Burndown Chart

Reflection

1. Did your estimations reflect the actual effort?

The story point estimates generally reflected the relative effort of the User Stories. More complex tasks such as **Process Finance Approval, Generate QR Ticket, and Validate QR Ticket** were given 5 points, while simpler tasks such as approvals and status tracking were given 3 points. Since this was a simulated sprint, the actual completion time was not used to measure development effort.

2. Was your backlog well-prioritized?

Yes. The backlog prioritized the core functionality of the system, beginning with event proposal submission and the budget approval workflow before moving to ticket generation and validation. This provided a logical order for developing the main system functionality.

3. How did your simulated sprint align with your plan?

The sprint followed the planned selection of User Stories and their assigned story points. The selected stories were moved through **To Do** → **In Progress** → **Done** during the simulation. Both Sprint 1 and Sprint 2 were completed as planned, although the work was completed much faster than it would be in a real one-week development sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed that all the planned story points were completed very quickly, resulting in a sharp drop in remaining work rather than a gradual decline. This indicates that the simulation did not represent a realistic distribution of work across the sprint duration. It also shows that all the selected work could be completed within the simulated sprint, although the simulation did not reflect a realistic distribution of work over the full sprint duration.
